

Climatic Change, Global warming. Global Change

"A permanent Conflict between Nature and the Human Being ", or

"What could it be done in order to let Nature take its course?"

The information below summarizes some concepts that are related to the human current activity, such as the Climate, the Meteorology and the so called Climatic Change. An approach to the existence of certain manipulation regarding this matter, or so we believe, will also be examined.

Some people claim that everything is caused exclusively by the CO₂ that human beings are continuously giving off and add that it also concerns the atmosphere (IPCC and Al Gore). Some others openly assert that something is happening, but admit that they do not really know what it actually is. Others just criticize every single aspect.

There are also people who claim that there is nothing to worry about because Climate has always been changing.

We agree that CO₂ is a great problem but, is this really THE PROBLEM that is worsening the Climate?

Would the problem of global warming be solved by just controlling the emission of CO₂? A non-polluted and a global view is essential to be able to estimate the magnitude of the problem we are facing.

Our aim is to avoid mistaking the analysis and the reasons because otherwise, it could be assured that solutions will also be mistaken.

CLIMATE changes can be appreciated by anyone. For instance, the increase of temperatures, which is a major factor nowadays, leading to the misadjustment of the seasons and, especially, the lack of rain or snow in winter as well as some other climatic phenomenons such as the punctually but very intense presence of tornadoes, unexpected rainfalls and floods in certain latitudes where it is unusual to happen, droughts or the melting of glaciers and poles among others, are changes that have to be taken into consideration as they can devastate whatever they find on their way.

It can be easily observed that something is happening with the atmosphere and that the WATER OF RAIN has a lot to do with it. However, it is not so easy to see that something is also happening with the CO₂.

Indeed our Planet is basically WATER.

We would like to stress all the effort we put into this in order to achieve that any mark left on our Planet, Land, Sea or Air, by human beings is as limited as possible and that it is attached the importance it actually has, but as we said before, IF WE MISTAKE THE REASONS, WE WILL BE LOSING A PRECIOUS TIME, BECAUSE WE WILL BE MISTAKING, ALSO, THE SOLUTIONS.

In our Planet many cycles are evolving simultaneously. Some of them are linked but in my opinion, the CO2 Cycle is far from being the most important issue when considering the Global warming

In other words, when turning from gas into liquid, the energy involved in the process is eliminated by expelling it out.

Hence, when we interrupt the Hydrological Cycle, we are also interrupting the natural process of expelling out the energy coming from the SEA, leading that way to continuously storage the same energy and resulting in the consequent warming which affects the SEA and our Planet in general.

The Water of rain is a natural unlimited resource when it is not dammed. On the contrary, when the Water of Rain is actually dammed, it becomes a scarce resource.

In our Planet, as it also happens with most resources, the amount of fresh water in use is limited.

It is not the CO2 the one that makes disappear the water coming from the constant snowfalls, glaciers and poles. What it is actually needed is a Hydrological cycle to support the water in use to be able to compensate the water that human beings dam in order not to waste it in the SEA ".

On balance then, an urgent KIOTO plan regarding the WATER OF RAIN should be set up and once again, it is important to remember that IF WE MISTAKE THE REASONS, WE WILL BE LOSING A PRECIOUS TIME, BECAUSE WE WILL ALSO BE MISTAKING THE SOLUTIONS.
